Audi TT RS Coupé and Roadster – Matrix OLED technology

For the first time in a series-production Audi, Matrix OLED technology (organic light emitting diode) is used in the rear lights as an option. These emit an extremely homogeneous, precise light. The light does not cast any harsh shadows and does not require any reflectors – this makes the OLEDs in 3D design efficient, lightweight and visually impressive. Each rear light contains four wafer-thin units that become smaller from the inside out. The biggest bears the TT logo and the four Audi rings.
